

Brennan Winans

Backend Software Developer (Java) | Remote-Ready

bchanceyw@gmail.com · github.com/255-Ping

Summary

Self-taught backend developer with several years of experience designing and building large-scale, data-driven systems in Java. Specializes in modular framework development, configuration-driven architecture, and event-driven system design. Proven ability to architect complex, multi-subsystem projects from scratch — translating high-level design goals into scalable, maintainable software while managing long-term project structure independently.

Skills

Languages	Java, Python, GDScript, Skript
Architecture	Modular framework design · Service registry pattern · Data-driven / config-driven systems · Event-driven architecture · State management · API integration
Backend	Custom persistence layers (YAML/MySQL) · Entity & attribute modeling · Rule-based engine design · Plugin-based ecosystems (Paper/Spigot)
System Design	Progression & dependency systems · Item/equipment frameworks · Crafting & economy systems · Ability & combat pipelines · Content authoring pipelines
Infrastructure	Arch Linux · Samba (role-based file sharing) · AdGuard Home · Device fleet management · Dual-boot deployment
Tools	Git · Gradle (multi-project) · YAML · MkDocs · Godot Engine

Experience

Backend Systems Developer (Independent — RPGCORE)

Independently designed and built RPGCORE — a 30+ module Java RPG framework on the Paper API. Sole architect and developer across all systems from initial design through active maintenance.

- Architected a service registry pattern — a core module exposes shared interfaces consumed by 30+ addon modules, none of which depend on each other, enabling independent deployment and extension
- Built a data-driven item and equipment system supporting custom RPG stats (damage, defense, strength, crit chance, mana) defined entirely in YAML — items dynamically loaded at runtime with persistent metadata surviving server restarts
- Designed a custom event pipeline that intercepts player actions, combat events, inventory interactions, and world triggers — routing them through stat modifiers, ability overrides, and effect stacks with consistent state management
- Implemented a configuration-driven crafting framework where recipes, loot tables, progression trees, and resource economies are authored as YAML data files — zero Java required for content
- Built custom progression systems covering equipment scaling, ability sequences, skill XP curves (configurable equations), status effects, and milestone rewards across interdependent subsystems
- Set up Gradle multi-project build (one jar per module), MySQL/YAML persistence with schema versioning and migrations, and a full MkDocs Material documentation site

Teacher's Aide / In-House Developer (Winslow Christian School)

- Built and deployed a configurable flashcard application used daily by students — per-student progress tracking, persistent saves, built-in scripting console, and live web build
 - Deployed a Samba file server on repurposed hardware with role-based share access (@teachers, @students, @admin), SMBv2/3 enforcement, and full audit logging
 - Configured AdGuard Home for DNS-level content filtering; managed a fleet of 12 dual-boot laptops
-

Strengths

Systems thinking, independent problem solving, and framework design — building backends where logic is separated from data, enabling content to be authored without touching code. Comfortable owning large projects with many interacting components across long development cycles.
