

Brennan Winans

Backend Software Developer (Java) | Remote-Ready

bchanceyw@gmail.com

Summary

Backend-focused software developer with experience designing modular, data-driven systems in Java. Strong foundation in system architecture, state management, and scalable application design using configuration-driven patterns. Experienced building complex rule-based systems, structured data models, and extensible backend frameworks with an emphasis on maintainability and performance.

Skills

Languages	Java, Python, GDScript, Skript
Backend Development	Modular system architecture · REST-style logic design · State management & lifecycle systems · Event-driven design
System Design	Configuration-driven architecture (YAML) · Entity & attribute modeling · Rule-based engine design · Scalable dependency systems
Tools & Workflow	Git / version control · Plugin-based architectures (Paper/Spigot) · Debugging & iterative design
Data Handling	Structured configuration systems · Persistent metadata modeling (attribute/state storage)

Experience / Projects

Backend Systems Developer (Independent Projects)

Designed and implemented a modular backend system architecture focused on configurable, data-driven logic and extensible system design patterns.

Key Contributions

- Built a configuration-driven system architecture using structured data files to define behavior, rules, and entities without hardcoding logic
- Designed a scalable attribute and progression system supporting dynamic state changes and calculated outcomes
- Implemented a modular rule-processing framework for handling item behavior, entity interactions, and system events
- Developed administrative and management interfaces for runtime system configuration and control
- Structured systems to support future expansion through loosely coupled components and reusable modules

Technical Focus Areas

- Data-driven architecture design
 - Dynamic state and attribute computation systems
 - Modular system decomposition and extensibility
 - Persistent structured data modeling
-

Strengths

Strong ability to design backend-style systems where logic is separated from data, enabling flexible configuration, scalability, and maintainability. Comfortable working with complex rule systems and translating them into structured, extensible software architectures.
